We have extensively characterized the unnamed commercial antibody against human ... protease cancer cells that were formalin fixed, paraffin embedded, sectioned and stained by IHC. We also tested our antibody by immunoblotting on unnamed marker over expressing cells compared to vector alone over expressing cells. Immunoblotting detects from 0-3 non-specific bands depending on the prostate cancer cell line. Thus we tested our antibody on xenografts from these prostate cancer cell lines and determined that this antibody does not detect these non-specific proteins by IHC.
